Library Support for Resource Constrained Accelerators

Laust Brock-Nannestad and Sven Karlsson
Technical University of Denmark

Motivation

- ▶ Accelerators provide attractive power/performance trade offs
- ▶ Existing programming models treat them as offload devices
- ▶ We want accelerator cores as **first class citizens**
 - ▶ Execute your application directly from the accelerator
 - ▶ Spawn parallelism **from** accelerator
 - ▶ But retain convenience of a complete system: libraries, file I/O, ...

Contributions

- ▶ A new runtime for accelerators
 - ▶ Accelerator drives execution – `main()` on accelerator
 - ▶ **Low overhead** – moving C library to host keeps runtime small
- ▶ Implementation on x86-64 and ARM + Epiphany (Parallella)
- ▶ Evaluation using SPLASH-2; comparison to libgomp
- ▶ Measure impact on object code size by minimizing runtime

Design

Figure : System architecture

- ▶ `main()`/master thread executes on accelerator
- ▶ Decisions on spawning parallelism taken **locally**
 - ▶ fast, low latency
- ▶ Accelerator **may** invoke host
 - ▶ Complex decisions or function calls (C library)
- ▶ Host assists accelerator, not vice versa

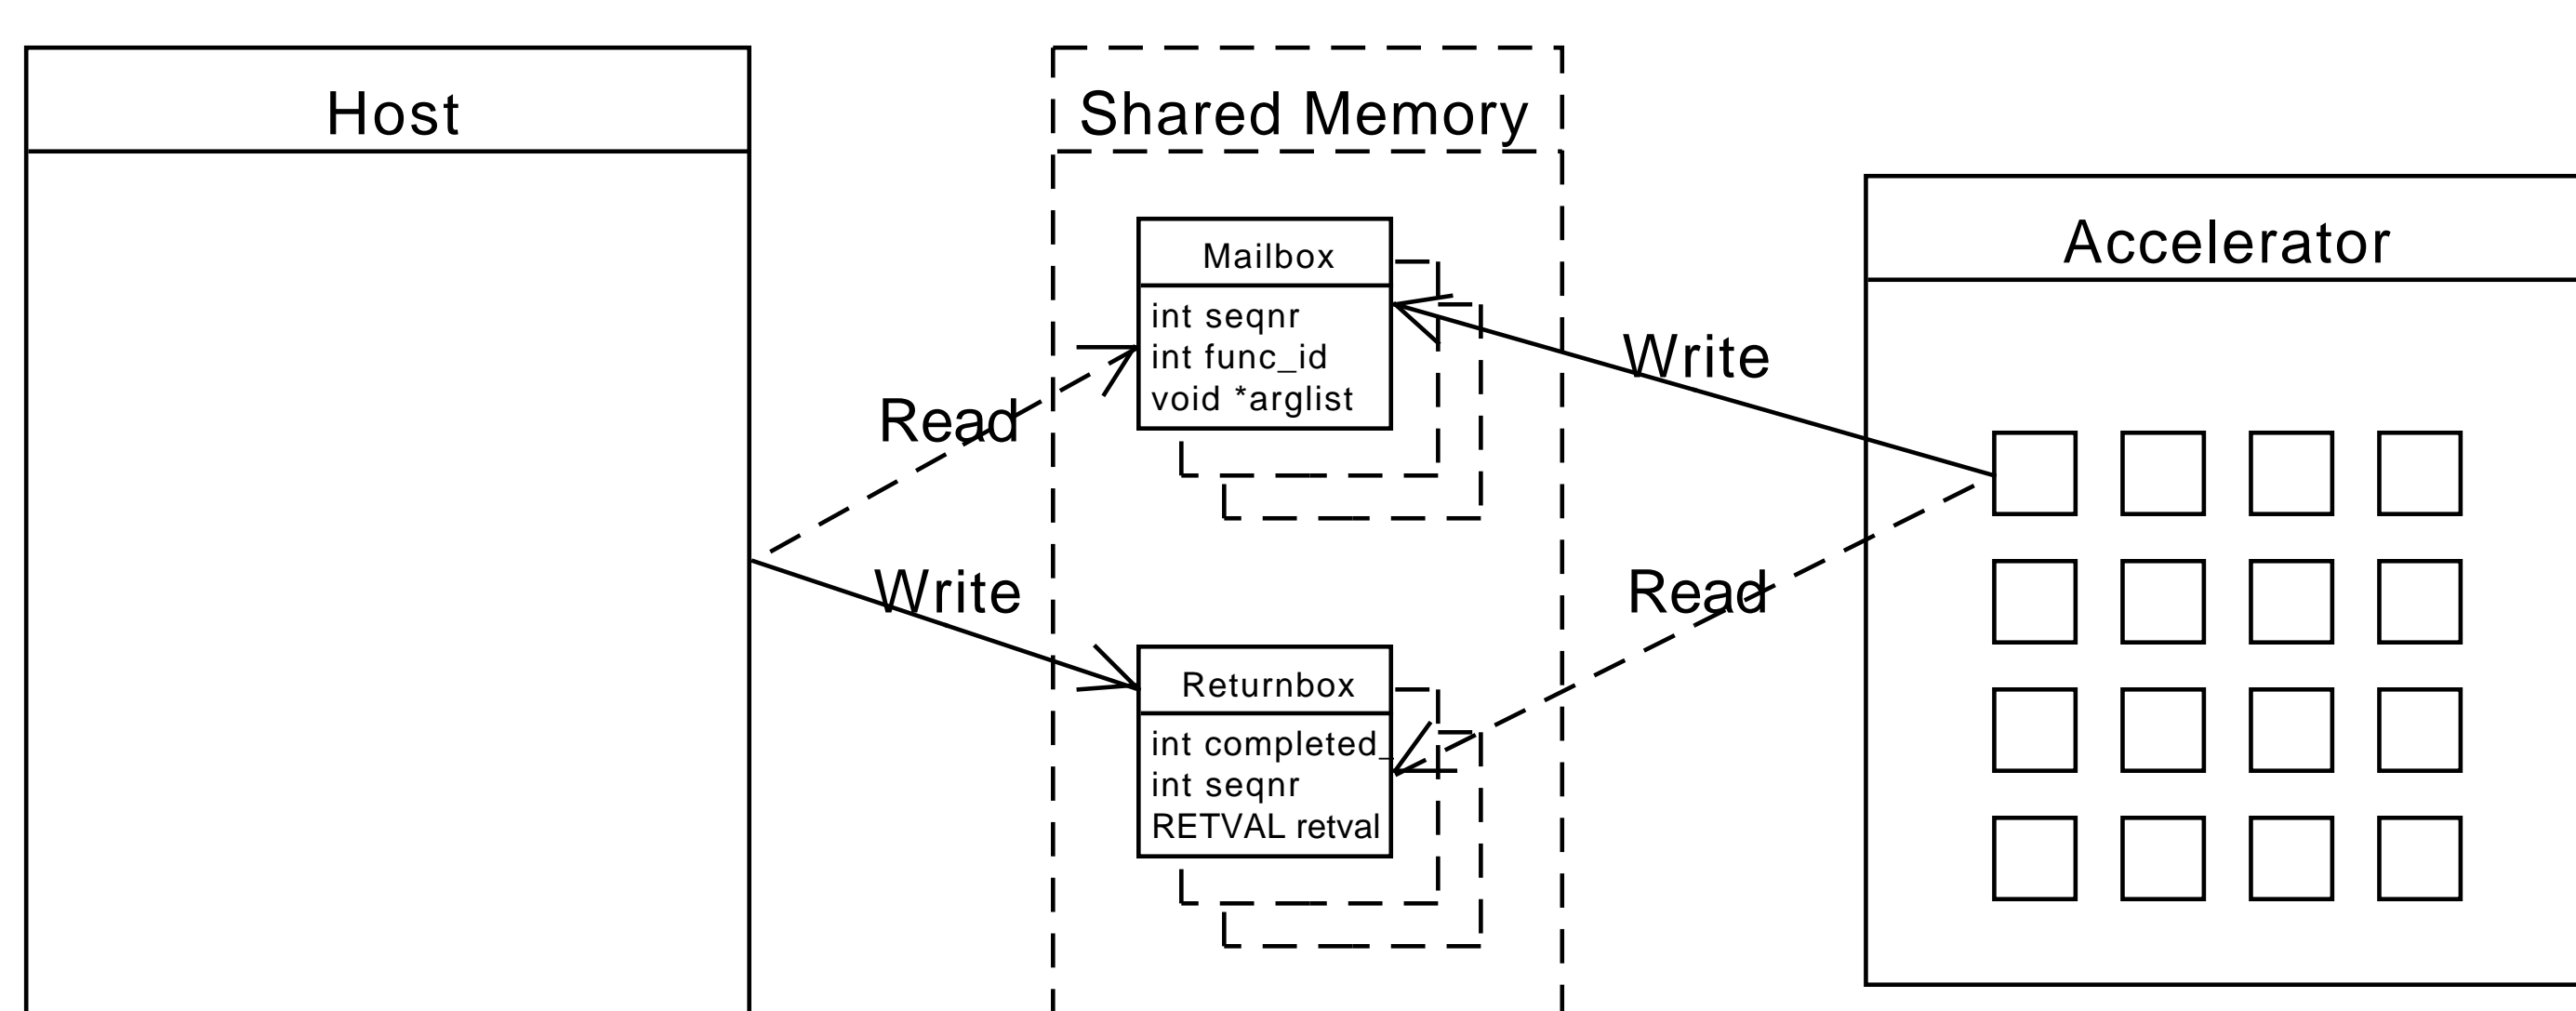

Figure : Mailboxes in shared memory

- ▶ Host and accelerator communicate through shared memory
- ▶ Mailbox data structures used for communication
- ▶ Encode function call identity, arguments, and results

Acknowledgments

This work was funded by the European Artemis project nr. 295440, Portable and Predictable Performance on Heterogeneous Manycores (PaPP)

Experimental setups

- ▶ 1) Dual Socket Xeon 5570 @ 2.93 GHz, Linux 3.2, GCC 4.8.1, glibc 2.17
- ▶ 2) Adapteva Parallella w. 16 core Epiphany accelerator
- ▶ SPLASH-2 benchmarks LU, FFT, C-runtime library offloaded to host
- ▶ Baseline is SPLASH-2 parallelized with GNU libgomp for GCC 4.8.1

Execution time (x86-64)

Figure : Execution time and speed up for increasing number of cores on **x86-64**.

Object code sizes and savings

C library function (sym)	Size (bytes)	FFT	LU
<code>_printf_fp</code>	9345	X	X
<code>_sin_sse2</code>	8569	X	
<code>_cos_sse2</code>	5159	X	
<code>_getopt_internal_r</code>	4391	X	X
<code>_int_malloc</code>	4776	X	X
<code>_int_free</code>	2796		
<code>_memset_sse2</code>	2705		X
<code>malloc</code>	333	X	X
(the rest)		271	565
Total		35044	22115

Accelerator runtime object code size

Accelerator component	x86-64 (bytes)	Epiphany (bytes)
Host interface	209	96
Locks, Barriers	159	178
Misc	130	228
Bootstrap/Initialization	202	138
Thread creation	49	0
Total	749	640

Conclusions

- ▶ Object code reduction of 66-75% on benchmarks by offloading C library
- ▶ Low runtime footprint of 750 bytes (x86-64), 640 bytes (Epiphany)
- ▶ Computational code not influenced by remote function call overhead – Performance comparable to GNU libgomp
- ▶ Initialization is single threaded. FFT initialization dominated by remote function call overhead (see paper for details)
- ▶ Future work
 - ▶ Parallella/Epiphany implementation soon to be released
 - ▶ Careful memory management – software caching techniques
